Observations

- There is a positive correlation of 0.84 between the average tumor volume and the mouse weight, which shows that when the mouse's weight increases, the average tumor volume also increases.
- Based on the Final Tumor Volume, the most successful drugs in reducing the tumors' size were Capomulin and Ramicane.
- Of these four drugs; Capomulin, Ramicane, Infubinol, and Ceftamin, only Infubinol had one outlier data point - the rest of the regimens did not have any outliers.
